Portfolio 2026

mmuratkurul@gmail.com · muratkurul.com

MURAT KURUL

Selected work 2024 to 2026 · Fresha · Tunnel Vision · AERØ · Postura

About

Hi, I'm Murat. I design things people use every day, on screen and off it.

I studied industrial design at Loughborough, so I learned to design by making things people hold. Every project started with interviews and testing, long before any CAD.

Then I spent a year at Contex Textile in Istanbul and redesigned the Conuk website, which went live. That's when screens hooked me. I taught myself web design with AI, YouTube and online courses, and I haven't stopped since.

I'm usually the person who ends up holding a project together, turning a messy brief into one clear next step.

Based in
Richmond, London

Studied
BA Industrial Design, Loughborough

Looking for
A junior UX/UI or product design role

Tools
Figma, Framer, HTML and CSS, Illustrator, Photoshop, Canva Pro

Methods
Interviews, usability testing, user flows, wireframes, prototypes

Off screen
Basketball, the gym, food and climbing

Case study 01 · Group project, Loughborough 2026

Fresha: from a raw sensor reading to one clear "safe to eat".

People throw food away because they can't tell if it has gone off, not because it has. Fresha is a handheld scanner that reads spoilage gases and answers in seconds, with an app that turns every meal saved into CO_2 saved.

My role
Storyboard, 3D model, prototype, 3 app screens including Result

Team and time
Up to four designers, 6 weeks

97%
Safe to eat

48%
Use your judgement

14%
Likely contaminated

One-handed body, fold-out stand, a sensor head that sits close to the food without touching it, and a screen that answers with colour first.

One action on Home, one answer on Result, one reason to care on Impact.

Home: one job
A single "Scan food" action, with recent scans below so leftovers can be checked again.

Result: the answer first
One number in a ring, a plain verdict ("Safe to eat"), then the detail. Green, amber and red always come with words, never colour alone.

Impact: a reason to care
Every meal saved becomes CO_2e saved, which unlocks rewards like planting a tree.

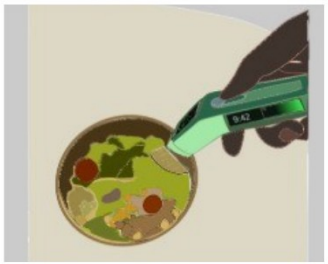

Redesigned in 2026
I updated my original screens to a cleaner, current UI for this portfolio.

1 What's still good?

2 The sniff test fails

3 Point Fresha at it

4 Read the answer

5 Green means safe

6 Eat with confidence

Tunnel Vision: one idea, designed to the rules of every screen.

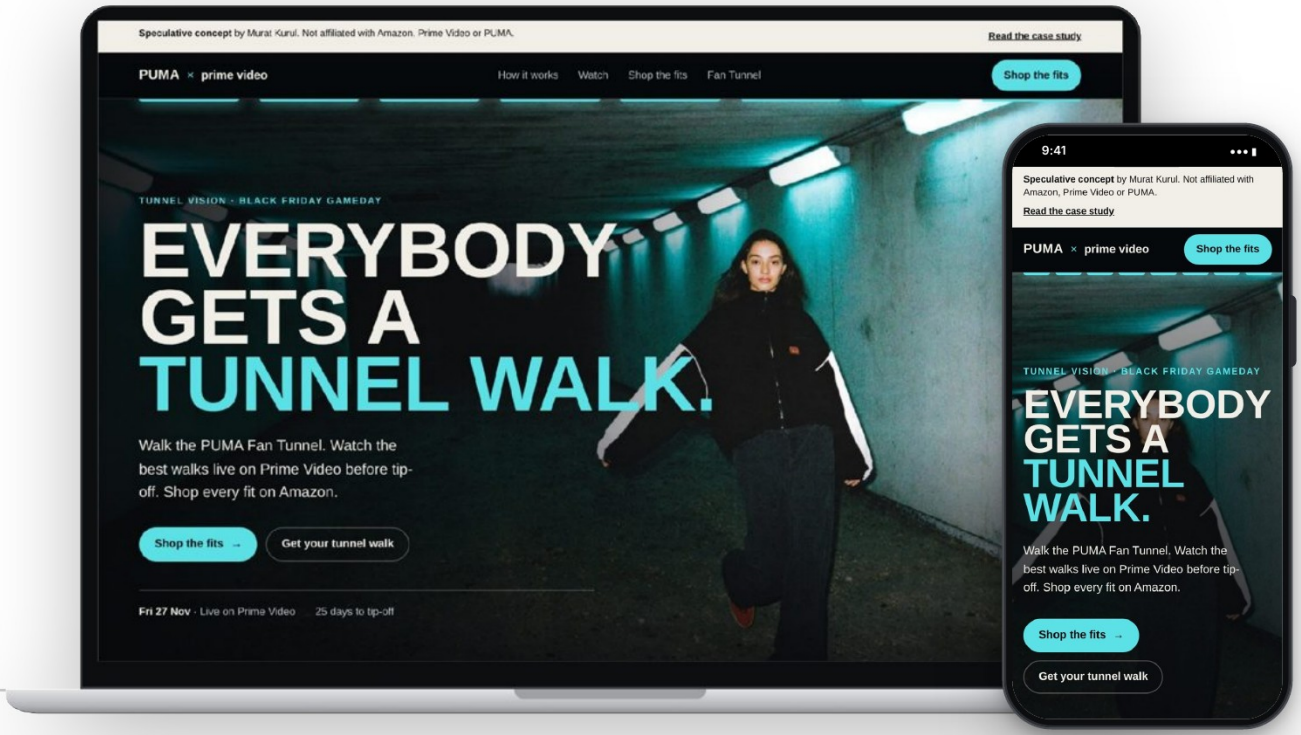

A spec PUMA × Prime Video campaign. I designed and built a responsive landing page, a four-size HTML5 display set, a Lottie banner, a Fire TV feature and a Prime Video pause ad, each to that surface's specification.

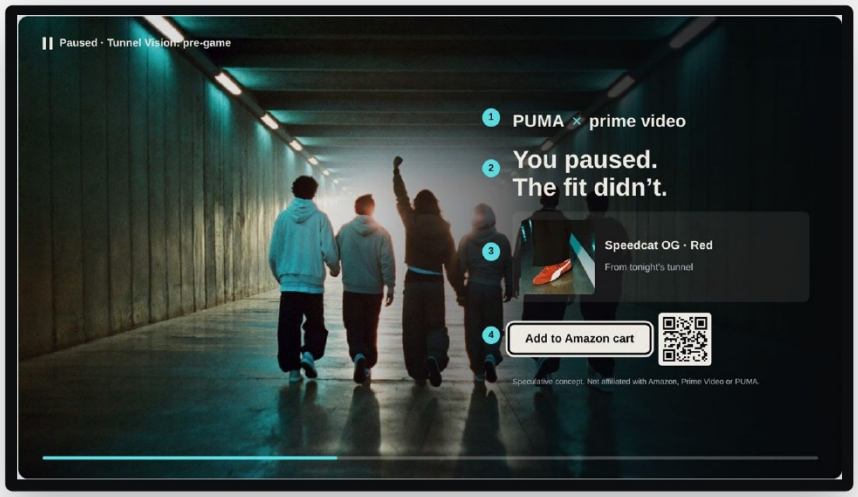

Honest by design
The spec notice loads first, and the cart and sign-up buttons say plainly that nothing is sent.

Built for handover
The landing page uses Webflow-style class naming, so it can be rebuilt one to one.

Pause, don't interrupt
The ad appears only when the viewer chooses to pause: one product, one action, a QR code.

Not affiliated with PUMA or Amazon. Photography AI-generated (Higgsfield) and retouched by me.

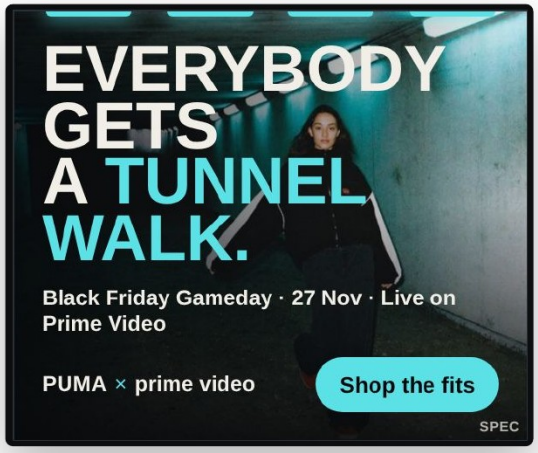

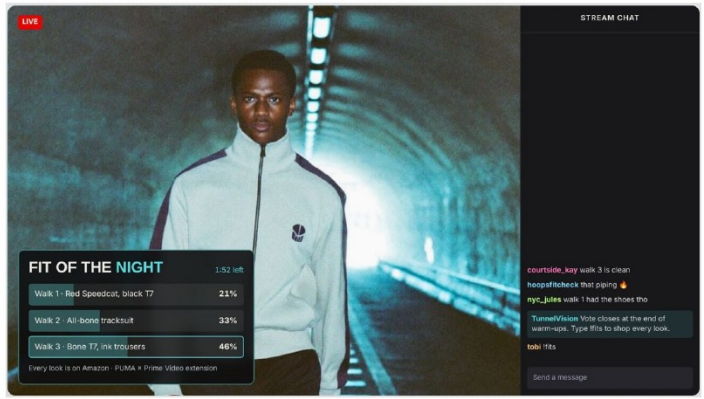

Prime Video pause ad: brand mark, a 27-character headline, the product and one remote action. It appears only when the viewer chooses to pause.

Checked against WCAG 2.2 AA before launch, from colour contrast to keyboard focus.

Check	Detail	Result
Bone on Ink	Body and headline text	**17.4 : 1 pass**
Ink on Tunnel cyan	Every call-to-action button	**12.7 : 1 pass**
Fog on Concrete	Secondary text on panels	**10.3 : 1 pass**
Motion	Reduced-motion users see end frames; banners play once, under 10 s	**Pass**
Keyboard	Skip link, visible focus, labelled ads and mock-ups	**Pass**
Forms	Visible labels, errors beside the field, focus moves to the error	**Pass**
Touch targets	Buttons and fields at least 44 px tall	**Pass**

300 × 250 HTML5 banner: plays once, ends on the call to action.

Twitch "Fit of the Night" vote extension.

Case study 03 · Final-year project, Loughborough 2026 · Industrial design

AERØ: a shoe dryer you clip in after training.

Sweat stays trapped in sports shoes after a session, causing odour and bacteria. Air drying is slow, and most shoe dryers are bulky and need a plug. AERØ is battery powered, has a handle and is small enough to live in a kit bag.

My role
Research, concept, CAD, prototyping and brand (solo)

Timeline
10 weeks

Tools
SolidWorks, KeyShot, Illustrator, 3D printing

Outcome
Working 3D-printed prototype

> 250,000 sweat glands in the feet can produce around half a pint of sweat a day.

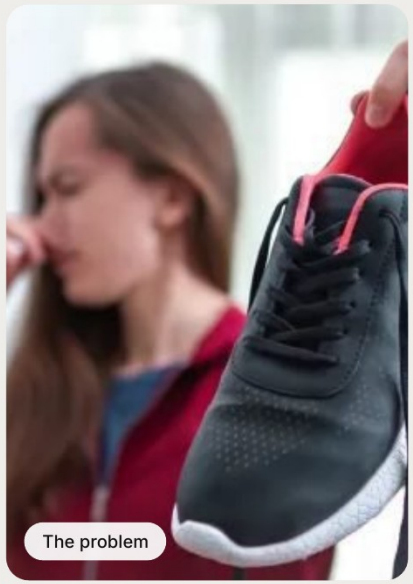

Tested before any CAD
Early concepts went to target athletes first, the same habit I bring to screens.

Designed for the kit bag
A handle and carabiner so it clips on and is forgotten until it's needed.

Clip in after training

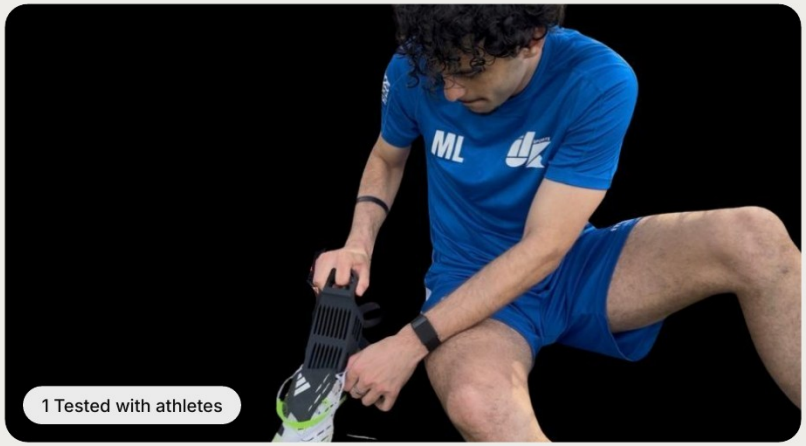

The product

The problem

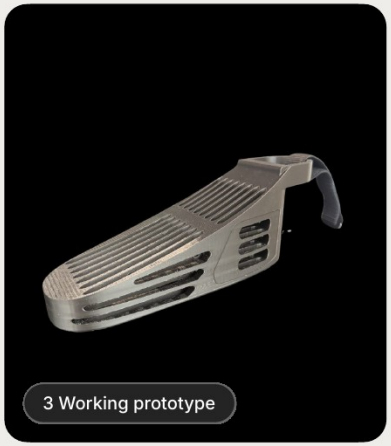

Lives on the kit bag

One per shoe

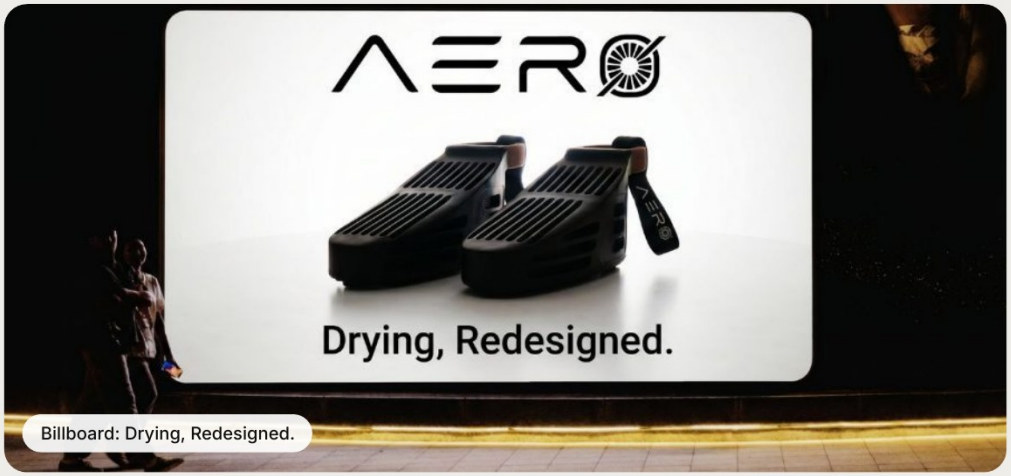

From athlete feedback to a working prototype, and a brand on the shelf.

One brand system, from the slashed Ø logo and a single orange to the shelf and the billboard.

Research · Dissertation, Loughborough 2026

What players wear changes how they play.

How does the look and feel of basketball footwear affect players' confidence, identity and performance? As a BUCS player myself, I could interview athletes as a teammate, not an outsider.

8
BUCS players interviewed

1 : 1
semi-structured conversations

TA
thematic analysis of transcripts

Method

1
Plan
Interview guide built around confidence, identity and performance.

2
Interview
Recorded and transcribed eight 1 : 1 conversations.

3
Code
Coded transcripts and grouped the codes into themes.

4
Apply
Turned the themes into design principles for later projects.

Findings I still design by

01
Start with the person's own words, then design.

02
How a product looks changes how confident people feel using it.

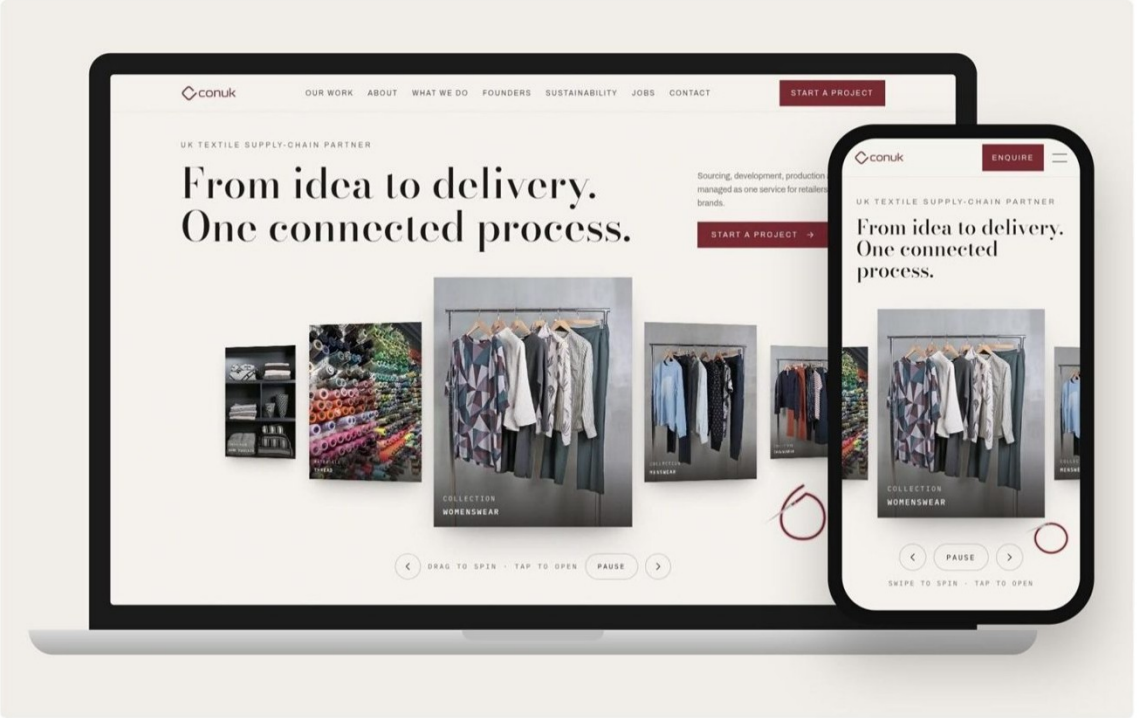

03
Identity matters as much as performance.

Two live sites, from Figma to launch.

conukltd.co.uk, for a client. At Contex I redesigned the Conuk Ltd website in Figma and took it live. I rebuilt the information architecture around one story, from idea to delivery, for UK retailers and fashion brands, and designed an enquiry flow that goes straight to the founders.

muratkurul.com, my portfolio. Projects arc over the bay of İzmir, then each opens as its own case study. I designed it and built it with AI-assisted coding, and tested it from phone to desktop.

Information architecture · Figma · Responsive · Live

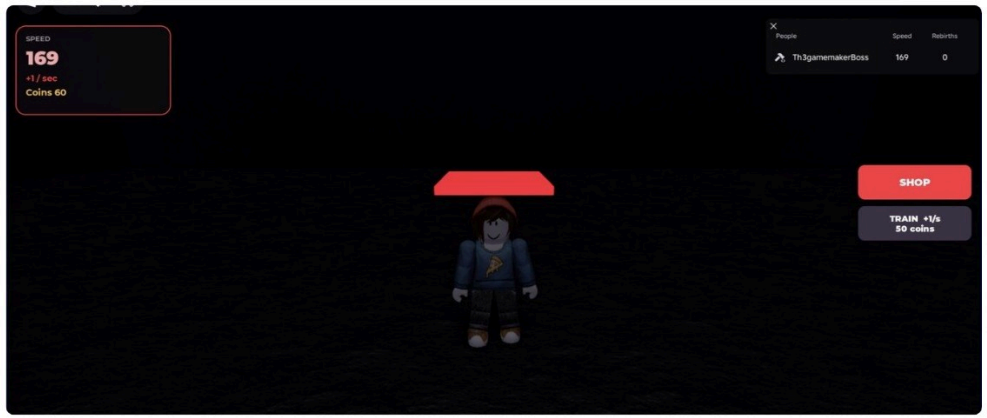

conukltd.co.uk, live: desktop and mobile

muratkurul.com, live: desktop and mobile

Outpace: a lobby that explains the game at a glance.

My Roblox chase game. New players landed in a dark, empty room with one red pad and no idea what to do. I redesigned the lobby around the one rule (+1 speed every second) and a colour-coded pad for each world.

Before

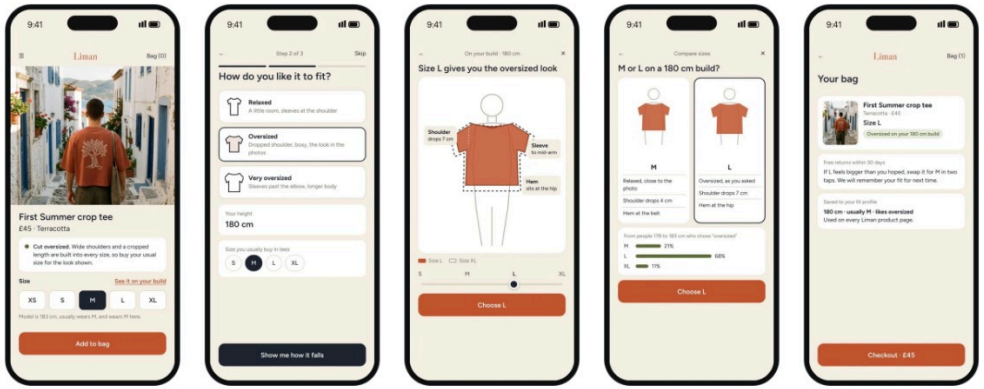

After

Drape: buy an oversized fit without guessing.

A self-initiated concept for my label, Liman. Shoppers can't tell whether "oversized" is already built into a cut, so they size up, size down or buy two. Drape shows how each size will fall on your own build, then recommends one.

Review mining | User flow | Mobile UI | Test plan

Product page, three questions, Drape view, compare, bag. Concept, ready for usability testing.

Case study 04 · Interactive prototype, wearable tech, 2024

Postura: a wristband that notices the slouch before you do.

An Arduino-programmed wristband that learns the difference between good and poor posture from motion data, then vibrates to nudge you upright before the slouch becomes a habit.

My role
Built the Arduino wearable, trained the classifier, product design, companion app concept

Duration
4 weeks, 2024

Tools
SolidWorks, KeyShot, Procreate, Arduino, Edge Impulse

Output
Working prototype, colour range, app concept

The idea

The feedback is a feeling on your wrist, not another notification on your screen.

Colour range tested across the bands.

It learns your slouch, then nudges you before it sticks.

01 · Collect

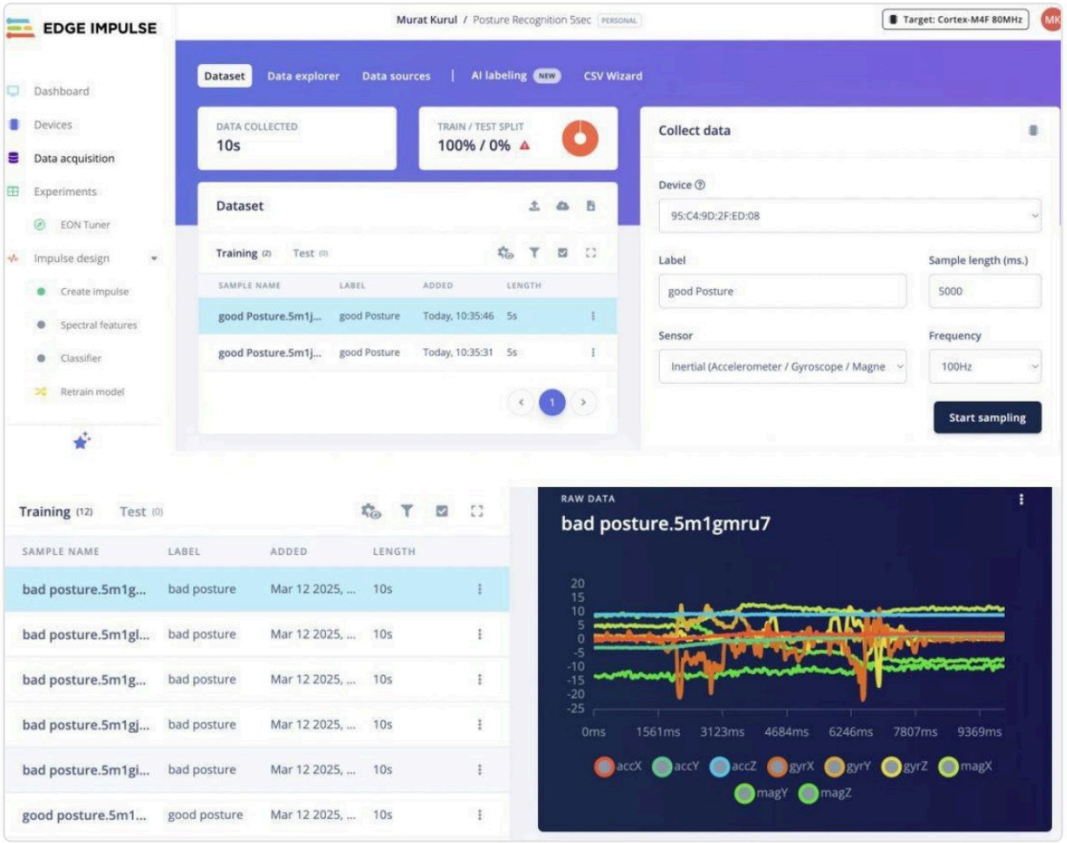

Motion data from the accelerometer, gyroscope and magnetometer, labelled good or bad posture.

02 · Train

A classifier built in Edge Impulse and run on the Arduino itself.

03 · Nudge

When it detects a slouch, the band vibrates. No app needed.

Training the classifier in Edge Impulse on labelled posture data.

Storyboard: slouch, buzz, sit back up.

In use: a slim band with a single module, worn all day at the desk. Lifestyle images are AI-generated visualisations (Higgsfield).

The band nudges. The app shows the pattern.

The band works on its own. This app is a concept for what it could add, designed to Apple's Human Interface Guidelines, in dark mode with the lime band as the one accent colour.

Today

Share of desk time upright, nudges, and the day as a timeline.

Live

Lean angle and the classifier's confidence, with one-tap calibration.

Trends

The weekly average, and the hour slouches peak.

Nudges

Vibration strength, how long to wait, and quiet hours.

From a glance at the Lock Screen to the settings behind the buzz.

1 Today

An upright ring, nudges and best streak, with the day as a timeline.

2 Live

What the band sees right now: lean angle and the classifier's confidence.

3 Trends

The weekly average, and the hour slouches peak.

4 Nudges

Vibration strength, how long to wait, and quiet hours.

5 Lock Screen

A Live Activity with time upright, so there's no need to open the app.

Concept screens, not a built app. Designed to Apple's Human Interface Guidelines.

Contact

Let's make the next decision on screen an obvious one.

I'm looking for a junior UX, UI or product design role in London or remote, and can start straight away.
